

Planar Bone Scintigraphy

Species:	Canine	Breed:	Doberman Mix
Age:	10 years	Sex:	female
Isotope:	^{99m}Tc	Chemical Form:	MDP

Interpretation: While I can not definitively exclude the possibility of a cruciate ligament avulsion, an early bone neoplasia of the distal right femur is suspected. The diffusely increased radionuclide uptake was noted in the left tibiotarsal joint is typical for osteoarthritis.
