

## Planar Bone Scintigraphy

Species: Canine

Breed: German Shepherd

Age: 6 years

Sex: male

Isotope:  $^{99m}\text{Tc}$

Chemical Form: MDP

**Interpretation:** This pattern is most consistent with a soft tissue (ligament +/- meniscus) injury of the left stifle joint. The increased radionuclide uptake in the right tarsal region is consistent with osteoarthritis, differentials include degenerative, traumatic or less likely immune disease.
